A quantum leap from Sinclair

WELL, here it is! The new Sinclair QL microcomputer.

It is based on the 68000 16-bit processor with 128K Ram and twin microdrives as standard, all for a price of £399. Also supplied with each machine is a highly advanced suite of software: spreadsheet, database, word-processing and business graphics packages — over 300K of machine code software supplied on four micro cassettes, each with an accompanying manual.

The machine will not be software compatible with existing ZX Spectrum software and the QL runs a new version

of Basic — the so-called SuperBasic.

Up to 90K is addressable in SuperBasic which includes structured programming commands and support procedures. Five user-definable function keys are provided. SuperBasic has a keyword entry mode.

The machine has a bit-mapped colour high-resolution screen — 32K of Ram is reserved for the display.

The QL has a built-in multi-tasking facility with a new QDOS operating system and full networking, enabling up to

Continued on page 5

Successors to the 64

COMMODORE has exhibited two new home computers — successors to the Commodore 64 machine — at the Consumer Electronics Show in Las Vegas.

Both are based around the same, a new microprocessor chip — the 7501 — and consequently software for the new machines will not be compatible with that for either the Commodore 64 or the Vic20.

The first new micro is to be called the Commodore 264. It has 32K Rom and 64K Ram of which 60K is addressable in Basic. Maximum screen resolution is 320 × 200 pixels and the 264 has two sound generators each with eight

SHADOW FOR THE BBC 32K

Shadow will allow you to make security back-up of your valuable tape software:
• Any OS • 100% machine code • Basic I and Basic II • 1000 + 300 baud • "Locked" programs
• Files • Any length • Easy to use.
Shadow works with 99% of all known programs including "locked" programs or those containing sections at 300 baud.
FREE Inspector a very useful memory viewing program which displays memory in colour coded sections for ease. Worth £8 on its own. Shadow + Inspector £8 inclusive.

BRITAIN'S BEST-SELLING MICRO WEEKLY

RICHARD SHEPHERD SOFTWARE

A HOME BUDGETING & BANKING SYSTEM THAT REALLY MAKES YOUR 48K SPECTRUM WORK!

A professional style multi function Cash Controller program that can load and make an entry in just **90 SECONDS** ... thanks to its **ZX MICRODRIVE COMPATIBILITY**. If you're not ready to upgrade to Microdrive yet, this easy to use cassette program can handle up to 400 transactions with your Spectrum, almost filling the 48K memory of your computer.

BANK ACCOUNT

- Statements on demand from any date to date.
- Holds up to 400 transactions.
- Standing order facility.
- All transactions can be automatically coded to allocate up to 16 budget headings.
- Search facility for any single item by description or amount.

HOME BUDGETING

- 16 budget headings, e.g. Gas, Rates, Car, Tax - you can choose the headings
- Highlights under/over spending
- Full budget expenditure breakdown
- Budget "re-think" facility

LOAN/MORTGAGE CALCULATOR

All you ever wanted to know but didn't like to ask! Calculates:

- Interest rates
- Payback periods
- Capital sum
- Period of loan

REMEMBER THIS CASSETTE CAN ALSO BE USED WITH ZX MICRODRIVE

● PRINTOUT FACILITY USING ZX PRINTER

● FULL SECURITY WITH PERSONAL PASSWORD

● FULL SAVE PROGRAM ONTO CASSETTE OR MICRODRIVE

Available from good computer stores or direct by mail order... **at a price that won't upset the Bank Manager!**

How to submit articles

Articles which are submitted for publication should not be more than 3,000 words long. The articles, and any accompanying programs, should be original. It is breaking the law of copyright to copy programs out of other magazines and submit them here — so please do not be tempted.

All submissions should be typed and a double space should be left between each line. Please leave wide margins.

Programs should, whenever possible, be computer printed.

We cannot guarantee to return every submitted article or program, so please keep a copy. If you want to have your own program returned you must include a stamped, addressed envelope.

Accuracy

Popular Computing Weekly cannot accept any responsibility for any errors in programs we publish, although we will always try our best to make sure programs work.

Editorial

The Games Centre, which went into liquidation last week, will be missed by games players everywhere. Together with its great rival, the Games Workshop, it provided a treasure house of board games, role playing games, electronic and even computer games.

Graeme Levin founded the Games Centre 10 years ago with a little shop in Hanway Street, London. He built it up to the point where it numbered nine different shops and turnover exceeded £4m. So, where did it all go wrong?

Ironically, according to Graeme Levin, part of the problems were caused by buying a computer. Misled by its reports, the Games Centre rapidly became overstocked with games that didn't sell. As a result, the Games Centre ran into severe cash flow problems.

The Games Centre was built around the idea of providing a focal point for gamers, with a shop manned and run by games enthusiasts. Perhaps, as the Centre grew and the business side became more important, some of that enthusiasm waned.

Graeme Levin, however, is unlikely to disappear. He co-authored the game *Speculate* and helped to bring games such as *Survive* and *Conspiracy* on to the market. His knowledge of games and the games industry is too valuable to waste.

There is obviously a market for shops such as the Games Centre as Games Workshop and the Video Palace have proved. But, it remains to be seen whether anyone will set up shop on as large a scale as the Games Centre.

Next Thursday

Next week's star game is Draughts for 16/48K Spectrum by David Cox — try to move the red counters to one side and the blue counters to the other.

Commodore

Continued from page 1

volume levels, programmable as either two music channels or one music and one white-noise channel. The full-size full-travel 67-key keyboard includes four pre-programmable function keys (giving up to eight user-defined keys when used together with the Shift key).

Software in the Commodore 264 Rom provides a full upper- and lower-case character set, built-in machine-code monitor and 'window' graphics capability. Spreadsheet, word-processing, file-handling and graphics software is available either as a built-in option or as a range of plug-in cartridges. Using the 'windowing' facility, for example, both spreadsheet and word-processing information can be viewed simultaneously.

The price of the 264 has yet to be finalised but it is expected to sell in the US for under \$500 (about £335). It is scheduled to go on sale in the States from April 1 this year and it is hoped that it will arrive in Britain in May or June.

Commodore's other machine is the Commodore V364. Very similar to the 264, this computer includes a built-in speech synthesizer with a vocabulary of over 250 words, accounting for its increased Rom size of 48K. Additional vocabulary can be soft-loaded from cartridge or disc. The V364 also features an 86-key keyboard including a 19-key numeric pad.

Sinclair QL

Continued from page 1

64 QL or Spectrum computers to be linked.

The Sinclair QL is 19 inches long and 5½ inches wide, with a full-size professional quality keyboard. It has tv and RGB monitor outputs and RS232C and twin joystick ports. Ram is expandable from 128K up to 640K. Although the 68000 chip is externally 16-bit, its internal architecture is 32-bit, making the QL considerably faster than an 8-bit chip such as the ZX80 (Spectrum) or 6502 (BBC and Commodore 64).

As is now traditional for new Sinclair products, the QL will be available initially only by mail-order.

Oric 2 makes its debut

ORIC will launch its new home computer — the Oric 2 — at the Which Computer? Show to be held at the NEC in Birmingham between January 17 to 20.

The machine will be very similar to the Oric 1 except it will feature a better keyboard.

The Oric 2 will have 48K Ram and be based on the 6502 8-bit processor. All Basic programs written for the Oric 1 will run without alteration on the new machine.

The price of the new machine is expected to be around £160.

Networking from Acorn

ACORN has announced a local area networking device for laboratory equipment.

The new IEEE Interface for the BBC computer is capable of addressing and controlling up to 14 devices — oscilloscopes, voltmeters, Spectrum analysers and other such equipment — compatible with the IEEE electrical standard.

The interface unit plugs into the 1MHz bus on the BBC micro and software to drive it, adding some 27 new commands to BBC Basic, comes on a Rom which plugs into the sideways Rom-slot on the BBC machine. The interface is then addressed using the command *IEEE.

Priced at £325, the IEEE

Left out in the cold

PRISM is offering a new service for micro owners who feel their machines are left out in the cold after the manufacturer's guarantee has expired.

For £14.99 a year Prism will cover the cost of repairs to any micro which retails at under £250; for £24.99 the cover is extended to include any machine costing up to £500.

Details from Prism Micro Care, Wellington House, Ashford Road, Maidstone, Kent.

Murdoch bid for Warner

RUPERT Murdoch is still continuing with his plans to gain control of Warner Communications — of which the ailing Atari computer company is a division.

He has indicated his intention to increase his stake from 6.7 percent up to 49.9 percent. For such a move he will need to raise somewhere in the region of \$900m.

Interface will find application mainly in research laboratories, colleges and schools.

Launched into orbit

SURREY University is to launch a new satellite into orbit in March.

This satellite, like the first (see *Popular Computing Weekly*, Vol 2 No 39) will be for use by amateur radio enthusiasts with computers who will be able to receive orbital data broadcast by the device as it circles the earth.

The satellite itself, standing about three feet tall, contains its own microcomputer built around the 1802 chip with 48K of Ram.

Roger Peel, software engineer on the £350,000 pro-

ject, said: "The new device will have better computing and telemetry than the earlier one which only had 16K on-board." The satellite stores information about temperature and magnetic field strength as it orbits the earth from pole to pole, transmitting data recorded over a whole orbit in short bursts. The increased memory of the new satellite means that more information will be able to be collected and transmitted to radio amateurs.

The satellite will be launched in March from an American Delta rocket.

Games Centre stores go under

THE Games Centre chain of specialist games shops has gone into liquidation.

The nine stores were claimed by their founder Graham Levin to have the largest range of puzzles and games anywhere in the world. The shops also specialised in selling home computers, video games machines and associated games software.

Graham Levin, himself a keen games enthusiast, opened his first store in 1974. Last year the chain had a combined turnover of more than £4m.

The decision to put the Games Centre company into liquidation was blamed by Graham Levin on 'bad cash-flow problems'. Since 1982 the company had been expanding very rapidly, opening seven of the nine stores in the last two years.

Colour monitors for micros

MICROVITEC has announced two new colour monitors — a 14-inch and a 20-inch, compatible with most home micros.

The models will operate in either of two modes, handling a standard PAL-encoded tv picture output with sound or taking an RGB monitor output from the computer.

The 14-inch is priced at £259 and the 20-inch costs £349. Details from Microvitec, Futures Way, Bolling Road, Bradford, W Yorks.

Puzzle It out

My office colleagues and I all own Spectrums and look forward every week to the puzzle in your magazine. Indeed, we have a competition to see who gets the answer first and also the quickest time when the program is run.

In an attempt to get the quickest time we came upon something your readers may be interested in — when raising anything to a power, it is much quicker and much more accurate to multiply numbers together than to use the power function \uparrow , ie $B \wedge B$ is better than $B \uparrow B$.

Type in the following programs and see the difference in time. Using the \uparrow function takes 13 times longer than multiplying together:

Program 1
10 for n = 1 to 100
20 let z = n \uparrow 2
30 next n
Runs in 13 secs

Program 2
10 for n = 1 to 100
20 for z = n * n
30 next n
Runs in 1 sec

Now insert: line 25 if z = 10000 then print z. You will see that program 1 will not print anything, whereas program 2 will print 10000.

David Senior

Violence and mayhem

Seeing my pal and patron, Mel Croucher, slugged in print the other week by a couple of your readers who seemed to think he was guilty of some hypocrisy for condemning aggressive games in the same magazine which carries a comic-strip style advertisement for his firm, Automata, depicting (nay, revelling in) scenes of torture, deceit, violence, etc. I feel bound, as the artist, to spring to his defence here.

It is assumed that Mel actually writes the scripts for these diversions. This is partly true. He passes these scripts to me. I take them to my studio, read them and throw them away. Then I write something entirely different, spiced with much jolly violence and mayhem.

I present the artwork to

Automata on the last possible day, in fact at the very last possible minute, leaving no time for corrections or amendments. Heh, heh. I don't know how I've got away with it for so long. I have a feeling that there's a plot going on, so if I "disappear" soon, you'll know who to point at.

I think that Mel, Christian, the PiMan and all at Automata

are pursuing a very laudable cause. I don't know about James Hickman (15) of Northampton, but I'm glad somebody's into spreading joy and happiness across the planet... but that doesn't mean to say they're gonna stop me! Oh, and to those of you who think the cartoons are irritating and childish, all I can say is, 'yah boo sucks rasp to you guys'!

Robin Grenville Evans
Hampshire

A sense of humour?

Enough of this high score nonsense on your letters page. Let's get some real computing correspondence going. I've had an idea.

Clive sold 100,000 ZX80s. For those who know not, a ZX80 is like a Spectrum, but two years earlier, without colour, sound or graphics, without most of the Basic, without decimal points and without a keyboard (well, almost). So, where are they now?

For every 10 Spectrums in the world there is a ZX80... somewhere. Are any still in use? Have you any theories as to their whereabouts? Most of all, did any of the PCW readers at today own a ZX80 in the days of the soldering iron?

Awaiting further correspondence, I shall kick off. My ZX80 was a Chrissy pressy in 1980. 1K was small even then, so I bought a 16K Ram pack. The 4K Rom could not be helped.

It was the first computer under £100 and I was amazed at its great capabilities. It was running a (laughable) invader game within three days. Within three months I learnt machine code on it — then the ZX81 came out.

My Ram pack was pressed into service on my (handbuilt) ZX81 and the ZX80 gathered dust for a whole year, until I met a Sharp MZ80K owner. He had worked out that his 80K, presently working on a Z80 cpu, could tolerate the extra speed of the Z80A. So, my ZX80 got butchered and for a nominal £1 sold its heart to the Sharp. The rest of the pcb went to an electronics freak who said he could make good use of the chips. And that was that.

Come on ZX80 owners. Show yourselves.

Mike Hampson (veteran)
7 Hereford Drive
Clitheroe
Lancs

ZX80 owners

I write in reply to L Hewelly (re: Deviant Ways, Letters, PCW Vol 3 No 1. First, the Losers cartoon is not simply there for the less able computer users as many people with quite formidable intellect and ability have a sense of humour unlike, it seems, L Hewelly.

Regarding the field of educational software, this is still very much in its infancy with very few educationalists actively participating in programming. To say that games

writing is more educational than educational software writing is ludicrous, as educational software is closer in general structure and technique to real business software than games. I have personal experience of young children using appalling structures due to taking short cuts and the trend for developing games at the keyboard.

Whilst in the area of structured programming, I would like to advocate that some magazine space be designated for the more noble of the programming languages, specifically Pascal which BBC Basic tries so hard to emulate. The inclusion of a Pascal column would be universally appreciated as Pascal, unlike Basic, is extremely portable and many of the more popular micros now support this language.

When L Hewelly refers to the Spectrum as a "hideous little plug socket" he shows very little of the intellect he exhibits elsewhere in his use of English grammar. All micros have their strong and weak points. The Spectrum is an idea first computer with its excellent manual and low initial cost. The BBC makes an excellent second micro due to its expansion possibilities, complexity and many superior features. Thus the role of the Spectrum more than warrants the amounts of simpler literature printed for it, not forgetting however that many extremely experienced users do in fact own Spectrums.

The comments about Automata are, in my view, uncalled for as Automata make a worthwhile contribution to PCW in providing some very good light entertainment.

Finally, (no quips please), high score tables. There is a large amount of interest shown in these so surely (remember democracy?) it must be the duty of PCW to provide for its readers if suitable means and safeguards can be found.

I join L Hewelly in wishing everyone a happy new year.

D J Parrot
61 Warrington Road
Dagenham
Essex

A Pascal column is an interesting idea, but perhaps a general language column would be of more widespread use.

"Ah well! It was fun while it lasted!"

SITUATIONS AVAILABLE AT

IMAGINE SOFTWARE LTD is the largest and most successful game software house outside of the U.S.A. with more than 100 staff occupying 19,000 square feet of premises throughout Liverpool. Imagine Software are at the forefront of today's exciting software industry. As a result of Imagines' advanced and imaginative expansion program the following positions have become available. In all cases remuneration is commensurate with ability and seniority and is above industry standards. In many cases a new car and numerous fringe benefits will be part of the package. Relocation assistance will be given to successful candidates wherever needed.

SENIOR SOFTWARE MANAGER

A position exists for a Senior Manager who will be responsible for several departments working in diverse areas of software design and production. Applicants must have proven experience in commercially orientated software environments and a wide range of technical knowledge and skills.

This is a very senior position with many exciting and rewarding aspects. Career prospects are excellent.

SOFTWARE MANAGERS

Two positions exist to manage large software departments at the forefront of the games industry. Applicants must have a proven knowledge and interest in computer games. A wide range of software skills and experience in managing programming staff.

SOFTWARE ARTISTS/GAMES PROGRAMMERS

Eight positions are available for programmers with both the technical ability and the creative skills needed to invent and code best selling games.

Fluency in at least one assembly language, artistic ability plus proven experience are the necessary qualifications. The successful applicants will be working in an innovative environment with the best available development software and equipment and will be provided with a high level of technical back up. This is the ultimate career opening for games programmers.

SYSTEMS SOFTWARE PROGRAMMERS

Two positions exist for systems software programmers working on very advanced products. Both positions are exciting and innovative. For the first, applicants must be fluent in the 'C' language and MCS68000 assembler and be familiar with Unix type operating systems. Applicants must be able to demonstrate a wide knowledge of advanced development tools.

The second position requires a fluency in pascal and MCS68000 assembler and familiarity with the UCSD operating system. Experience of computer graphics and general business orientated applications software will be an advantage.

PROGRAMMERS

Thirty positions exist for programmers working in a team environment on many diverse aspects of microcomputer software, including the conversion and adaption of games to new microcomputers.

Applicants should be fluent in at least one assembly language and have great familiarity with at least one currently popular consumer microcomputer. Experience is not necessary but provable ability is a qualifying factor.

GRAPHICS PROGRAMMERS

Two positions are available for programmers with skills, experience and knowledge of microcomputer graphics as applied to games software.

Applicants must be fluent in at least one popular microcomputer assembly language and preferably have a working knowledge of one other, plus familiarity with currently available microcomputer capability. Provable experience and/or ability essential.

COMPUTER MUSICIANS

Two openings are available for programmers who have the ability to write music and sound effects for popular micros. The applicants must have a good knowledge of an assembly language and proven musical skills.

GAME DESIGNERS

Two positions exist for game designers to design a wide variety of entertainment software. Applicants will have both experience in general games design and theory plus a working knowledge of microcomputers.

TECHNICAL WRITER

An opening exists for a technical writer to prepare software manuals for both commercial products and internal development tools. A recognised writing qualification will be necessary for applicants as will a very wide working knowledge of microcomputers.

GRAPHIC ARTISTS

There are six positions available for artists working on games design and production using computer based graphic tools. A knowledge of microcomputer graphics plus excellent artistic skills are the qualifications for these positions.

Applicants should in the first instance send their C.V. to:
PERSONNEL DEPARTMENT, IMAGINE SOFTWARE LIMITED
IMAGINE HOUSE, 5 SIR THOMAS STREET, LIVERPOOL L1 6BW
or ring for an application form:— **051-236 8100 (20 lines)**

MISSION - 1

**BECOME A
SECRET AGENT**

PROJECT VOLCANO

Mission Software's complete package on Project Volcano, is probably the most advanced Adventure Computer Game Package you have considered this year. It is not just for the dedicated game player but for those that want to get involved in Secret Codes - Messages, and the sexy-side of DIS (British Intelligence) and the K.G.B. IT IS A MUST FOR THE SINCLAIR SPECTRUM 48K AND DRAGON 32 HOME COMPUTER OWNERS.

When you receive your Adventure Game from Mission Software Limited, included in the package is your Passport to the international workings of the Secret Agents. Your personalised Passport will assist you in negotiating the K.G.B. network in the Soviet Block Countries and vital to the success of your mission.

Command Headquarters will give you information that other Agents have recorded together with their Communication Log, Mission Instructions, Secret Memoirs, Classified Diagram, Full Briefing Instructions and other Secret Data.

IT'S UP TO YOU TO BREAK THE CODE AND BECOME A SUCCESSFUL SECRET AGENT. We rely upon our Agents to feed back information to make further projects interesting and complex, to test your ability and to guarantee many hours of enjoyment.

We believe Mission Software Limited is the only company that supports its Field Agents with a mass of Secret Information to make the Mission exciting and enjoyable which makes it a must in Computer Games.

- We know your friends will want to become Secret Agents and use your game, we will be quite happy to supply them with their Passport and Documents for £2.95 per kit. This way you always retain your personal Passport and Secret Information.
- The moment you tell us you have completed your current assignment we will advise by Secret Data, details of how to penetrate one of the World's most secret establishments.
- To obtain your Game and personal Passport with all its Secret Documents send a Cheque or Postal Order for £8.95 (inc. P.P. & V.A.T.) with the Coupon at the foot of this advertisement.

ORDER MISSION 1 TODAY AND JOIN THE GROWING NUMBER OF SECRET AGENTS OPERATING FROM COMMAND HEADQUARTERS.

£6.95

Noughts and Crosses

A new game for 16K or 48K Spectrum by Barry Ashfield

In this version of Noughts and Crosses you are given the option of playing against the computer (Clive) or you can select the two player mode and play another person. In the two player game the player who inputs the first name will have the first go and will be nought. In following games the first go alternates between players, scores are kept and displayed on the right of the screen. To make a move just select the number of the square and press enter.

Playing against the computer you have a choice of levels (hard or very hard) and you are given the first go with nought. If you should defeat the computer the learning routine is brought into action and you will have to try another trick next time!

The learning routine works by storing

the sequence of moves in g\$. If the game results in a defeat or a draw (Clive's first turn only) the contents of g\$ are transferred to c\$ and remembered. If the same sequence is encountered in a later game a different move is made, so the longer you play the harder it becomes to win.

It is possible to keep this information by Saving "oxo" LINE 40. On reloading the game will continue where you left off. 16K users should delete all REM statements. It is possible on 48K machines to make c\$ larger, but note that Line 42 (wdr) will need alteration as well.

Notes

1-200 Draws Screen and sets up variables
200-220 Alternates turn
500-570 Input move and DATA for printing X or O
1000-1110 Check for win or draw

2000-4030 Computers move
5000-6050 Draw NOUGHT/CROSS
6100-6430 Draw win lines
7000-7250 Score/next game
9000-9200 Start game/choose level
FNm() generates random move
FNu() checks for best move
won players score
lost Clive's score
drawn number of draws
c\$ stores winning moves
b\$ checks for new move
g\$ stores current moves
u\$ check win/draw/lose
f\$ first player's name
s\$ second player's name
vh game level
two 1 or 2 players
ch change turn
wdr value of c\$
xoro nought or cross
m\$ input move
m computers move

Pickled eyes for tea

David Kelly talks to micro artist Stuart Hughes

To a science-fiction illustrator, the home microcomputer boom is a dream come true.

The whole industry is absorbed with aliens, far-away galaxies and improbable androids. For those who make a living out of painting cassette inserts and book jackets, computers are a licence to be paid for having fun.

Surprisingly though, there are few artists who successfully make a living out of micros. Internationally known sci-fi artists like Jim Burns and Tony Roberts are out of the league of all but the very biggest software companies.

The top micro artists can almost be listed on the fingers of one hand — David John Rowe who does work for Quicksilver and Interface, Steve Blower with Imagine, Malvin Bagshaw, Ian Craig and Stuart Hughes.

Stuart has done paintings for both software houses — Sinclair, Artic, Softex, — and computer book publishers — Addison-Wesley, Granada and Sunshine.

Being a commercial artist is a job just like any other — and Stuart has to work pretty hard. He may do seven or 10 paintings a month. The companies he works for he calls 'clients'; they tell him what they want and he produces the goods, often to quite tight deadlines. If pushed, he can turn round a finished painting in three days.

He reckons that painting is a craft he's learned like any other. "There is this myth that people are born gifted — either you can draw or can't draw. It's not true. If you want to do something and you work at it you'll do it." The first day Stuart was at art college, in his home town Liverpool, set the tone for him. "The guy said take something out of your pocket and draw it. The only thing I had was a paper tissue."

"I drew that one tissue over and over for eight hours. If you spend that amount of time drawing and painting you get better at it."

After one year's foundation course Stuart then did a three-year degree course at Norwich. "After Liverpool, Norwich was a culture-shock. A friend of mine used to walk down the street swearing at people just to try to get a reaction — Norwich is very 'nice'."

The course wasn't to Stuart's liking either. "I was spending six weeks designing the title page of a book — I couldn't cope with that. After a year I just got on with painting and drawing."

"The course was not so much to do with what you could produce, but how you could talk about it. 'When you do a painting people either like it or they don't — you shouldn't have to talk about it.'"

After Norwich, Stuart did teacher-training and then taught for a year in a junior school in Liverpool. He realised that he missed drawing and painting very much

— he gave up, moved down to London and after a couple of months, started getting some work, mostly from girls comics.

He also started selling some of his slightly macabre surreal paintings — jars of pickled eggs with eyes, pig-shaped sausages on a plate.

"I always used to read science-fiction books but not to do sci art — my stuff was more strange, slightly surreal fantasy. I sort of fell into it by doing the early covers of *Popular Computing Weekly*, which Ian Craig and I shared between us."

Stuart paints on boards about A3 size, using an airbrush to create an almost photo-like realism. An airbrush uses a compressor to produce a fine controllable spray of paint. With the compressor going, painting is a noisy business and he has to wear a mask to prevent inhalation of the air-borne paint-spray. "The airbrush is just like a can of spray paint, except you have far greater control over the size and pressure of the air jet."

"My aim is to be able to paint absolutely anything I can think up in such a way as to make it believable — you can believe there is a giant eye floating in the sky with a waterfall pouring out of it."

A new commission begins with the software company ringing up with the title of the game. Very occasionally, Stuart will see a pre-production version of the game — he has a 48K Spectrum and is a keen micro-enthusiast. "Then I just get on with other paintings — the time thinking about the new game." Two ideas people help — friends Laura and Val.

The idea for Artic's *Inca Curse* came to Stuart in the pub. "It depends what I'm into at the time. When *Inca Curse* came along I

was into skulls and bones."

The next stage is a rough pencil sketch and collecting references. Stuart draws mainly from photographs and has a filing cabinet stuffed with pictures of every conceivable object. When painting a face, he will often take a photograph of a friend which he then prints up himself to work from.

After the client has seen the rough sketch and given the go-ahead, the painting is started. Using the airbrush Stuart first puts down the background, masking off the main subjects — the skull in *Inca Curse*, for example — with acetate sheets.

Most of the rest of the painting is also airbrushed, with only the fine detail drawn with an ordinary paintbrush. Sometimes the details of faces are finished with oil paint, but that can take up to 10 days to dry. In many cases the liquid acrylic paint of the airbrush is used throughout.

Stuart charges between £200 and £400 for a cassette cover, depending on the quality of work and time taken to do it. At present, Stuart rarely has time to spend more than four or five days on a painting. "It's hard work — prior to working for the micro industry I'd always spend more than two weeks on a picture, I've had to train myself to work faster."

In his spare time, Stuart is a keen runner. Until his knee injury cut short his running career at 17, he was the second fastest runner in the country for his age. He still runs when he finds time and he has taken up teaching again, one day a week at the local junior school. "I just paint, sleep, run and paint some more, with an occasional glass of beer."

"When I have a spare moment I play with the Spectrum. I'd like to be able to produce a computer version of a painting which could then be used on the screen as the game was loading."

Yet, two years ago, Stuart didn't know home micros existed. "I couldn't believe my luck when I was first asked to do sci paintings. I'm really enjoying myself — I just keep waiting for the bubble to burst."

"It's just me painting what I want to with nobody turning round at the end and saying 'You've got to put a moon in the sky' or add something else in. Those are the kind of hassles you get in more stable fields like children's books."

"I can see computer artwork becoming more like that — more stodgey — as the companies mature. Some of them have already got art directors. Even now some houses are beginning to concentrate on what they reckon will sell the product, rather than producing an image that is interesting or different."

"In the end they will lose out — just like anybody else, I work better if I feel involved. The aim is to end up with something both of us — me and the software house — are proud of."

"The great thing about computers is you can paint just what you want. I could paint flowers — neon flowers — and I'm sure I could sell it."

Echoes of a distant past

Andy Wilson sees in the new year with a round-up of ZX81 software

When Clive Sinclair launched the ZX81 on an unsuspecting public, I wonder if he realised he was inadvertently creating a whole new industry?

Soon after the ZXs appearance, software houses started popping up everywhere. Previously, although it had been possible to obtain games on cassette for the Pet, ZX80 and TRS80, the market had been very small.

Reading the *Street Life* column in *PCW*, one soon becomes aware of how many companies started life writing games for the ZX81. Nowadays though, hi-res graphics, colour and sound are all the vogue — and the trusty old ZX81 is looking somewhat neglected. Although it is still selling steadily, very few companies are producing new software for the ZX81. If however you have just splashed out on a *Starter Pack* and are becoming bored with *Backgammon*, there are still quite a lot of games on the market.

One great challenge for programmers was writing games for the unexpanded 1K ZX81. With a full display file there are only 100 or so bytes to play with, so most attempts have been rather unsuccessful.

Micromega have tried to tempt the 1K ZX owner with their *Challenge* gamepack. The first thing one notices is that *Challenge* comes packed in a large box containing a large single-sheet instruction booklet and a small cassette. Delving around in the box for the cassette, we find it contains five machine code games. One of these, *Cartoon-man*, cannot really be called a game as it just consists of a nicely animated figure who can be walked across the screen at varying speeds. It held my attention for about a minute.

The little man appears again in *Juggler*. This time, his on-screen wanderings have a purpose. If you are quick with the keys, and manage to stay awake, you will find yourself juggling with As and Us. If you drop three the game is over. You may choose to play again, but this is unlikely.

Two of the games test your skills as a budding James Hunt. In *Brands Hatch* you are treated to a map of the famous race-course which you have to try to negotiate in record time. I spent most of my time spinning round in ever decreasing circles and disappearing up my own expansion port.

Road Race features an accurate map of the British Isles, with two roads between London and Scotland. According to the blurb, you can race your left hand against your right hand or challenge a friend. Alternatively, you could load the next game.

Meteor Strike is the only game on the tape that held my attention for more than a couple of minutes. Someone at Micromega is obviously a cartographer, be-

cause the game is based on an extremely good map of the world. This can be scrolled from side to side, in order to make the meteors falling from the top of the screen land in the sea. As this is almost impossible, I found it much more interesting to see which countries I could destroy first.

To start a new game with a new map you have to reload the whole game. This is a pain because, as with the games on this tape, the ZX81 has to be switched off then on again. All in all, nice maps — shame about the games.

When you have made the inevitable upgrade to 16K, you could try buying *Galaxians* from Quicksilver. In this stripped down copy of the arcade original, you are attacked by swooping Vs and Ws which you fire at with an A. Surprisingly, the graphics are quite effective. The movement is fast and smooth, and you can get very involved in the game.

Wobbly birds and exploding eggs

Unfortunately, your base neither moves nor fires fast enough in comparison to your attackers to make it possible to defend yourself properly. I only managed to clear the first screen a few times, and that was with the easiest possible combination of options. You have a choice of speed, rate of fire and the number of swooping *Galaxians*.

The demo mode is more fun to watch

than usual as the game is different every time. If you manage to shoot a few *Galaxians* before you bite the dust, you can enter your initials on the lengthy hi-score table.

The most surprising thing about this game is the inlay blurb. You thought you were firing a laser cannon at alien spacecraft? Not in this game you're not! Your attackers are large wobbly birds dropping exploding eggs and your only defence is a dragon gut catapult.

The tape is also supposed to contain a second game, *Gloops*. As my review copy is devoid of anything remotely *Gloop*-like I do not feel in a position to comment. As for *Galaxians*, I loved the inlay blurb and the game wasn't bad either.

New releases for the ZX81 are rare nowadays, so *Door Slammer* from Cathedral Software is very welcome. On loading, you are presented with a nice flashing picture of, guess what — a cathedral, followed by optional instructions which run over five screens. The object of the game is to close all the cathedral doors by walking through them; stripped down, it's a bit like the old 'can you join the dots with x lines without taking pen from paper' type puzzle.

Added difficulty is provided by a ghost and a trapdoor. The ghost is totally invisible, and you don't know he's there until he slams you in the door, killing you instantly. It is well worth wandering round in the hope of being slammed, as you are treated

with a great picture of a smirking ghost crushing you 'twixt door and frame. If you manage to lock yourself in a room, you may be able to escape through the trap-

door, whereupon you reappear at random in another room. As the game is written in Basic it is rather slow, but as it is supposed to be a game of strategy rather than reactions, this doesn't matter too much.

A big fault in the programming is the hi-score table. As it uses the Inkey\$ routine for entering names, you have to use full stops instead of spaces. Although the game as a whole is a nice idea, after several plays I came to the conclusion that it is impossible, and started getting bored.

As an added bonus, the tape contains a machine code routine for inverting the screen which can be used in your own programs. As this routine is only a few bytes long, and has appeared in practically every micro magazine and book, its usefulness as a bonus seems limited. Nice thought though.

Another relatively recent release is *Astral Convoy* from Vortex, another game where the aliens have more in common with H G Wells' martians than with good old cuddly ET. In this universe, their evil little minds are intent on destroying a defenceless convoy. Defenceless that is

apart from you, the gallant pilot of a well armed small white square.

Your mission is to blast those nasty, and probably slimy, aliens back to meet their creator. They try to hinder your task by depositing nasty spiked space mines. Hit one and it's your turn to chat with St Peter.

The keyboard layout takes some getting used to — the services of a good surgeon to rearrange the layout of your fingers might well make things easier. Most of my criticisms of this game might well stem from the fact that I wasn't very good at it. If alien zapping is your forte, you will probably enjoy it.

Maze Death Race from PSS is the only arcade game in this review that I keep returning to. It reminds me of *Rocke! Chase*, a predecessor to *Pacman* in which you were chased round a maze by homing missiles while you tried to run over, or eat, all of the dots. In *MDR*, you are driving a racing car pursued by baddies in other cars who smash into you in a suicidal fashion. The maze is nine times the size of the screen and scrolls in four directions.

Fast, smooth and tense...

You have to try to run over 10 asterisks on each screen, and every time you complete a screen an extra chase car appears to make life more difficult. Fast, smooth and tense, I found it a joy to play. My only criticisms concern the almost total lack of instructions and the fact that it has to be loaded in two parts.

In general, not being very good at most arcade games I tend to prefer adventures. One of the earliest releases for the ZX81, and still featuring in the top 10 charts, was Psion's *Fantasy Games*.

There are two games on the tape. The first, *Perilous Swamp*, is really an introduction to the more advanced *Sorcerers Island*. In *Swamp* you wander round fighting monsters and trying to rescue a princess. The fights are arranged on a points basis and are rather unpredictable. The commands you can enter are very simple, either a compass direction or a decision to fight, run or bribe.

Island is much more challenging. You still fight monsters using your strength points and the commands are still very simple. Your aim is to escape from the island with the aid of various spells, medals and keys you find on your journey. A map of the island is available on request and you are kept informed of your immediate surroundings. The map is drawn in Fast mode, but seems to take forever.

Monsters range from mice, which invariably run away, to dragons, which don't, with other strange creatures popping up everywhere. Can anyone tell me what a Bunyip is? Although I prefer more traditional adventures, *Fantasy Games* is an ideal introduction to adventuring.

The last game in this review is *Ocean Trader* from Quicksilver. More of a simulation than an adventure, you play the part of a mercenary manner, trading between five British ports. You paid for your ship with a loan from the finance company, who you will certainly have to visit again for capital. True to life, they charge exorbitant interest rates and, if you owe them too much, they will repossess your ship.

You select your cargo from goods on offer at the port and then set sail. Seagoing hazards include pirates, fog and storms, losing your cargo being the most common outcome of encountering any of these. If you reach the next port with cargo intact, you can choose to sell or buy.

The instructions are very lengthy and are loaded separately — if you have a printer, I advise you to list them. I played this game for hours and would recommend it to any budding capitalist.

There is still a lot of good software available for the ZX81, but watch out, there is a lot of rubbish as well. Highly recommended games not included in this review include Psion's *Flight Simulation*, Artic's adventures and, of course, the offerings from New Generation. Finally, a plea to all of the software houses, there are still a lot of us ZX81 owners out here, please don't forget us.

A change of key

Trevor Toms moves on to the keyboard in the last of the series on machine code

Now we move on to the keyboard. If you've been following these articles religiously, you'll be well aware that I've used a ROM routine (which I call *Await-key*) at address 15D4h to obtain keyboard input. This routine is reasonable, but it suffers from one or two drawbacks.

First of all, it actually suspends operation of your program until a key is pressed. This is probably undesirable, since what I suspect most programs require is a sort of *Inkey* facility whereby a zero reply is given if no key is being pressed. Secondly, it's too slow since it uses the system variables *Repper* and *Repdel* to control repeat key actions. You can alter the value of these variables, but it doesn't get away from the fact that machine coded programs are normally intended for speed.

Listing 1 shows a subroutine which simulates the *Inkey* function exactly. On returning, register L contains the code of any key being pressed, or zero if no key. Register H as usual contains zero, allowing you to maintain a degree of consistency in your work. In practice, the direct Basic equivalent of this subroutine is "*Code Inkey*" since it gives the code value rather than a physical string.

This routine is fast, although not as fast as direct keyboard scanning. If you want the fastest action, your best course is to use "*IN*" commands along the lines suggested in chapter 23 of the Spectrum handbook, since in most cases, programs requiring this degree of speed will be

arcade-style games. As an example, if you want to detect any of the keys B to Space on the bottom row, you would write:

```
LD BC,32766      ;scan bottom right B-SPACE
IN A,(C)         ;obtain key data
AND 1Fh         ;isolate keyboard data only
CP 1Fh          ;test for a key press
JP NZ,key$press  ;jump if a key is being pressed
                ;otherwise continue
```

If you are interested in one particular key, say the "N" key, you could rewrite the above routine to mask the single bit corresponding to that key. The five keys are represented by the five least significant bits of the returned data, and a zero value in any position indicates that the key is being pressed. So to detect "N", you would write:

```
LD BC,32766      ;scan B-SPACE keys
IN A,(C)         ;obtain half-row data
AND Bn          ;isolate "N" key status, bit 3
JR Z,NPRESSED   ;jump if key is being pressed
```

This method has the distinct advantage that multiple key pressing can take place and the program will be able to detect them all. Against this, the disadvantage is that you cannot easily and quickly discover the "code" value of the key without some lengthy conversion coding. The *Inkey* routine in Listing 1 cannot detect multiple key pressing, although it will continue to recognise the latest pressed key, so you must choose the best method of detection according to your own needs.

Listing 2 gives a full *Input* simulation for you to include. It places all received data

into the area addressed by the system variable *Eline*, and places a carriage return (hex 0D) character at the end of the string. If you want a prompt to appear in front of the cursor, you should send your string to stream 1 before entering the routine. On return, register pair HL contain the address of the first character of the entered data. The routine sets flags as if *Line* data is to be entered, and so if SHIFT/6 is pressed, the subroutine sets HL to zero on exit. In this way, your program can detect any "break" attempt.

In any case, this routine does not clear the bottom two lines prior to accepting data — your program must do that first (this allows you to display a prompt) by calling a ROM routine at address 0D6Eh which I'll refer to as *XCLslow*. Your complete input routine would therefore look something like:

```
XCLSLow: EQU 0D6Eh
XCLs: EQU 0D6Bh
SELDEV EQU 1601h

LD A,1          ;select lower screen
CALL SELDEV
CALL XCLSLow    ;clear lower screen
LD HL,PROMPT    ;prompt string address
CALL PRINT$STRING ;display prompt —see part 4
CALL INPUT      ;see listing 2
```

At this point, HL hold the data address or zero if SHIFT/6 has been pressed (I'll ignore this for the moment). We could process it as required, but for now I will merely copy it on to the top line of the display:

```
PUSH HL          ;save data pointer
LD A,2           ;select main display
CALL SELDEV
```

PROMPT: DEFB 16 :string length
DEFM "Enter something:"

As a small exercise, you may like to alter the program given in an earlier article to use the *Inkeys* routine given this week instead of *Wait\$Key*. The difference is very noticeable!

The last routine this week is a subroutine that converts ASCII numeric char-

acters into a 16-bit unsigned binary value. This will help you to allow numeric data to be entered into your *Input* routine, and then to be converted for subsequent use. The subroutine is called *Asc\$to\$bin* and is shown in listing 3. It expects registers HL to hold the address of the ASCII string, and on returning, HL holds the converted binary value. Conversion stops when a non-numeric character is found (numeric characters are '0'-'9', or 30h-39h).

Asc\$to\$bin relies on the MUL16 subroutine given in the first article of this series. It also uses a small ROM routine at address 2D1Bh to test whether a character in register A is a valid ASCII number. Here's how to use the entire package this week:

```

LD A,1         :select lower screen
CALL SELDEV
CALL XCLSLow   :clear it
LD HL,MESSAGE :print a prompt

```

```

CALL PRINT$STRING
CALL INPUT      :obtain data
LD A,H         :check if SHIFT/6 was attempted
OR L
JP Z,0         :if "RAND USR 0" if error
CALL ASC$TO$BIN :convert data to binary
LD (ITEM),HL    :save the converted data value

```

This rounds up the current series; in the next series, later in the year, we'll move on to the floating point calculator and also study ways of using full arithmetic and printing of binary or floating point values. Personally, I tend to stay away from the calculator in machine code, since it's so much easier to write this type of routine in Basic (and it runs almost as quickly!), but there are still occasions when it comes in handy.

AGF

PROGRAMMABLE JOYSTICK INTERFACE

for Spectrum or ZX81

MICRODRIVE
COMPATIBLE

ONLY
32.95
+£10.00p

ABOUT OUR INTERFACE

The AGF Programmable Joystick Interface is a unique design offering the use of any Atari-compatible joystick with absolutely all software, whether it is cassette or ROM cartridge, with the Sinclair Spectrum or ZX81.

The hardware programmable interface requires no additional software and accurately replicates the keys of the computer in a manner which is responsive to absolutely ALL key reading methods, both BASIC and Machine Code.

The interface does not interfere with key operation and can therefore be used simultaneously with the keyboard.

There is no need to remove the interface once fitted as the rear extension connector will accommodate further expansion, i.e. printers or RAM packs etc. This important feature avoids excessive wear to the expansion port.

The key replication principle pioneered by AGF means that your own programs can use eight directional joystick movement by utilising simple key reading BASIC.

Two joystick sockets are provided which share the same keys, for use with the majority of two player games. Several interfaces may be used on the same computer for multiple joystick applications.

The interface is programmed by a two digit code, which is looked up on a programming chart supplied, for each direction and firing button. The two numbers are then selected on a pair of leads which are clipped onto appropriately numbered strips on the interface.

Once configured this can be marked on a Quick Reference Programming Card for storing with the game. As the programming is not power dependent the interface retains the last configuration made and can be immediately used when next switched on.

KEY FEATURES

- Programmable design gives TOTAL software support.
- Accepts Atari, Competition Pro, Wico, Starfighter, Quick Shot, Le Stick etc.
- Rear extension connector for all other add-ons.
- Free demo program and instructions.

PACKAGE CONTENTS SUPPLIED

- Programmable Interface Module as illustrated, complete with clip-on programming leads.
- Self adhesive programming chart detailing how to define which key is simulated by UP, DOWN, LEFT, RIGHT, and FIRE. This can be fixed on to the case of your computer or if preferred the protective backing can be left on. The chart is made of a very durable reverse printed plastic and is extremely easy to read.
- One pack of ten Quick Reference Programming Cards for at-a-glance setting to your games requirements. The card allows you to mark the configuration in an easy to read fashion with space to record the software title and company name.
- Video Graffiti demonstration program which is written totally in BASIC to illustrate how all eight directions and fire can be read. This is also a useful high resolution drawing program.
- 12 months guarantee and full written instructions.

Force and motion

Roy Masfield presents a program based on Isaac Newton's Laws of Motion

The name of Sir Isaac Newton conjures up in everyone's mind the one word — "gravity". But gravity is only one part of the vast field opened up by his pioneering work. This work, culminating in the formulation of his Laws of Motion, now permeates the whole of classical physics and mechanics, and, of course, was the basis on which Einstein and others built their theories, modifying the work of Newton.

Until Newton's time (1642-1727) ideas of force and motion were vague, to say the least, although astronomers had already amassed a great deal of data on how the heavenly bodies moved. It was generally believed, for instance, that a body could be kept in motion only if a force were continually applied.

Newton, in a series of simple experiments and beautiful logic, showed that, once set in motion by a force, the body would proceed in a straight line when the force was removed, and could go on for ever. It could only be deviated from the straight line or made to change its velocity by the application of another force. This is the essence of his first Law of Motion.

Newton did what others had failed to do:

he made precise definitions of Force, Mass, Velocity, Time, Distance and Acceleration, and he derived a set of simple equations relating these quantities. His second law relates force with mass and acceleration, and the third stresses that action and reaction are equal and opposite. From these equations it is possible to deduce the behaviour of moving bodies, given certain initial data.

For our present purposes we will leave out force and mass, and assume that acceleration is produced by some unspecified force. So we have five quantities to consider: Initial Velocity (u); Final Velocity (v); Distance (s); Time (t) and Acceleration (a). There are three fundamental equations which relate these quantities:

$$s = ut + \frac{1}{2}at^2 \quad (1)$$

$$v^2 = u^2 + 2as \quad (2)$$

$$v = u + at \quad (3)$$

Given any three of these quantities, it is possible to juggle with the equations to derive the other two (except when the three given are final velocity, distance and time, because it is then impossible to find initial velocity unless we know the acceleration).

There are 12 possible combinations

and so in any particular problem, it is a matter of choosing the right one. For some combinations two equations have to be used in sequence. The accompanying program was developed to automate the selection and do the donkey-work.

When RUN, you are asked to input values for u, v, s, t and a, entering a ? for the unknown quantities which are to be found. The program will then select the equations and print the answers along with the data. If the forbidden combination (v, s and t) is entered, the printout will inform you so.

Some of the equations involve taking a square root, and sometimes the data will lead to a negative value to be rooted; this is impossible for the computer, so in these cases you will again be told. In one combination (s, u and a input) there will be two times printed, generally one positive and one negative. This is because a quadratic equation has to be solved, and, as you know, there are always two roots to a quadratic.

Negative times can be ignored, but two positive times means both are legitimate answers. If the roots of the quadratic are imaginary (not real) then you will be told so. Remember, too, negative accelerations can be entered — they are simply decelerations. If negative velocities and distances are output, they imply motion in the opposite direction.

THE DAN DIAMOND TRILOGY

*My name is Diamond,
Dan Diamond,*

and this is my story. A story of beautiful mermaids, bored robots and dank, dark dungeons. A story that started one muggy day in New York, and like the Big Apple, it's rotten to the core.

The Dan Diamond Trilogy is three separate adventure games. Each game may be played on its own, but clues may be found in the earlier adventures which may help later on. Each game comes with a lavishly illustrated 20-page case file, and hints (both helpful and misleading) which have been hidden in the illustrations.

Part I. Franklin's Tomb, in which our hero receives a mysterious plea for help which leads him to a hidden tomb and the mystery of the stargate.

Part II. Lost in Space, in which our hero finds himself stranded on a derelict spacecraft, doomed to travel endlessly through space, or find a way out.

Part III. Fishy Business, in which our hero lands on a watery planet, discovers the source of the plea for help and saves the day.

All three programs cost £9.95 each and are available for the DRAGON 32, BBC MODEL B and 48k ORIC-1 microcomputers. (note: Fishy Business for the BBC and ORIC will be available February 1984).

"It must be the most consistently enjoyable adventure game I've ever played"
—Computer Choice
Program of the Month

New from **SUNSHINE** Master your ZX Microdrive

programs, machine code and
networking by Andrew Pennell

Master your ZX Microdrive contains all
the information you will ever need to use
the ZX Microdrive to the full. Clearly
explained, with many examples, it is
equally suitable for the relative newcomer
to BASIC through to the experienced
machine code programmer.

ISBN 0 946408 19 X

Andrew Pennell has also included a full database file handling
program to let you put the ZX Microdrive to practical use
with your Sinclair Spectrum.

Look out for the Sunshine range ■ W.H. Smith's, Boots, John Menzies,
other leading retail chains and through our national network of book
shops and specialist stores. Dealer Enquiries: 01-437 4343

Please send me

☐ Master your ZX Microdrive at £6.95 each

I enclose cheque/postal order for £..... made payable
to: Sunshine Books, 12/13 Little Newport St., London WC2 3LD.

Paint it black

J Smith presents a simple program for drawing and printing hi-res graphics

This is a very simple and relatively short program, occupying just over 2K of memory. It allows the drawing of either black and white graphics on the Dragon's highest resolution, or full colour in medium resolution with the added capability of painting different areas of the screen. In addition, both the monochrome and colour screens can be transferred to permanent copy using the four colours of the Tandy CGP 115 printer.

In fact, though the program is short and simple, it appears to offer similar capabilities to the commercial programs now appearing on the market. The program listing and notes which follow explain how it works, so I shall only add a brief description of the use of the right joystick for drawing and the keyboard for selecting the other facilities.

Joystick functions — on running the program you are asked to select monochrome or colour drawing. Having done so, you are given a clean "sheet" of white screen to draw on, with the cursor flashing at the top right corner. The drawing colour is automatically set to white at start up, so the joystick can move the cursor about without leaving a trail.

To start drawing, use key 6 for black and 5 to return to white (which can therefore be used to draw over and "rub-out" any incorrect lines). In full colour, use key 3 for cyan (printed as green), 7 for magenta (blue) and 8 for orange (red), again returning to 5 for white (to move without drawing or "rub-out").

Keyboard functions — to fill in a shape with colour (or black), first make sure that the shape is complete with no gaps (or

else the "paint" will leak out and cover the whole screen). Next, move the cursor so that it is inside the shape. Then, press the F key and the joystick button.

To clear the whole screen to white, just press C at any stage of drawing. If you decide you want to change from black and white to full colour or vice-versa, then press B which returns you to the colour selection screen.

To use the tape recorder, press S. This will give you a prompt to start the tape running by setting the recorder to Play. When you have found the bit of tape you want (which will be either a clean part, for saving a picture on, or the start of a file containing a picture that you wish to load) press the Enter key and the tape recorder will stop.

You will then receive a prompt to put the tape recorder at the appropriate setting for saving or loading, with a further request to press Enter. The final prompt is input 1 or 2 to save or load respectively. These two functions are then carried out automatically, after which you are returned to the drawing screen again.

The last keyboard function is to press P, which will automatically set the printer to reproduce the drawing on the screen. By turning the picture on its side (see notes for line 630) the full width of the paper is used for the shorter vertical side of the screen, while the longer, horizontal side of the screen, is printed down the length of the paper. If you are only printing a drawing or a small section of the screen, you can stop the printer and return to the main drawing program at any time by pressing

Apart from using this program freehand, as it were, it is also possible to extract the printing subroutine at lines 600 to 770 and incorporate it into any other basic program with the Gosub lines inserted at the appropriate point; i.e. in your own main program insert lines 220 and 430 to lead the program to the screen printing subroutine when key P is pressed.

One other way of printing a hi-res screen from any Basic program which is already running is to use the following sequence: Break the program at the scene you wish to print. This, of course, returns you to the text screen (although the hi-res screen is not on view, it is still in memory and can be brought back using Screen 1, 1). Next, load my program from tape. Then, Edit line 100, remove the PCLS5 (so that the hi-res picture is not erased) and type direct mode (i.e. do not use a line number) Goto 70. Do not use Run or memory wipe clean.

You will then be asked to select the appropriate colour mode. After inputting 1 or 2, you will have the scene from the previous program displayed. As you are now in the main program loop, press P and the printer will be set into action.

Acknowledgement — as will be obvious to anyone who has a copy of the excellent book *The Working Dragon 32*, lines 260 and 270 and the general structure of the tape save/load subroutine are based on ideas by David Lawrence.

Numeric Variables

M =	Set monochrome or colour
N =	Set Pmode
S =	Size of printed pixel.
Q =	Magnification factor (fill the printer paper width)
X & Y =	Location of drawing cursor on screen.
Z =	Colour selected for drawing.
C =	Colour for printer to use
S =	Flag to allow printer to jump pixels which are not set on the screen (ie white)
PE =	Peek to see if joystick button is pressed.
J(1) =	Joystick allocation

String Variables

AS = Reads key pressed for colour selection and subroutines.
 ES & IS = Blank variables to allow tape recorder to be switched on and off.

Notes

70-100 Sets up the screen for drawing either in Pmode 4 (hi-resolution black on white) or Pmode 1 (medium resolution in colour — cyan, magenta, orange on white).
 110 Draws cursor top right.
 200-310 Main program loop.
 210 Read joystick.
 220 Read keyboard.
 230 If no key pressed then colour selection (set by Z) remains the same.
 240 If alphabetic key pressed go to subroutine 400.
 250 Store value of numeric key pressed in Z to maintain colour chosen.
 260-270 Moving right joystick moves cursor.
 280-290 Make cursor flash on and off so it is not lost against background.
 310 Return to start of main program.

Subroutine 400-460

REM statements are self-explanatory.

Subroutine 500-590

510 Use enter key to switch on tape recorder.
 520 Switch off tape and prompt to put tape recorder in record or play mode.
 530 Select saving or loading a picture on tape.
 540 Save picture as machine code file.
 580 Load picture from tape.
 Subroutine 600-770 Print out picture on TANDY CGP
 610 Select graphics mode.
 620 Start pen at top left on paper.
 630 & 760 Loop to read pixels on screen in reverse (to avoid mirror image on printer).
 640 Pressing "R" while printer is running will return to main program.
 650 Read colour of pixel on screen.
 660 If colour is white jump drawing routine to leave paper blank.
 670 If pixel colour is cyan set pen colour to green.
 680 If pixel colour is magenta set pen colour to blue.
 690 If pixel colour is black (in Pmode 4) set pen to black.

If none of the above colours is set then the red pen corresponds to orange pixels.

700

Get printer to select appropriate coloured pen.

710

If program has been scanning white pixels then pen has to be moved, without drawing, to the next point for a colour plot to be printed.

Note reversal of X and Y from the screen to Y and X co-ordinates on the printer to turn the picture on its side. This together with the magnification of Q makes maximum use of the smaller width of this printer's paper.

720-740

Draws an X at the selected location. As each vertical line of screen is completed the pen must lift off the paper and return to the next line of pixels.

750

Return pen to left side of paper when the picture is completed.

770

Subroutine 800-820 If joystick button is pressed the area is painted in, starting at the cursor, and using the same colour as the cursor, extending until it reaches a surrounding line of similar colour (hence the need to ensure the area to be painted is completely enclosed).

TURN YOUR PROGRAMME UPSIDE DOWN

Now you can add another dimension to your games.
Swap direction, swap functions, confuse your friends.
In fact you can add almost any twist to your games with
Stonechip's Programmable Joystick Interface.

You can also listen to them
with Stonechip's Echo Amplifier.

Programmable Joystick Interface. This also enables any Spectrum software to be used with a joystick, irrespective of which keyboard keys have been chosen for function.

Programming is easy using only a single switch. Switch one way ■ program and another way to play. No tapes ■ load or links ■ worry about — all programming ■ achieved by hardware. Used with Atari-compatible joysticks. Simply plugs into rear expansion port of ZX-Spectrum. No other connections ■ make, no additional power supply required.

Echo Amplifier. How would you like ■ listen to the sound output from your ZX-Spectrum without ear strain? The Stonechip Echo amplifier can do this for you as well as easing the tedium of saving or loading of tapes and enlarging the range of tape recorder compatibility with the computer. The amplifier has volume control over a range adequate for most uses, and a tone control for harsh or mellow sounds. A switched interface removes the need ■ swap leads during 'SAVE'ing or 'LOAD'ing. Leads are left connected ■ the time and the desired function ■ selected on the three position switch by the user. Use ■ the 'CUE' facility enables an audio cue to precede the program being 'SAVE'd' on tape, a decided advantage when searching through a multi-program tape. The Echo simply plugs into the Ear, Mic and Power sockets of the computer and does not require an additional power supply. The expansion port at the rear of the computer is left free for use with other peripherals and the unit is housed in an attractive

case custom designed to complement the ZX-Spectrum.

POPULAR COMPUTING WEEKLY

Graphic power

D Cartwright presents a demonstration program of five graphic subroutines

This is a demonstration program which shows the speed and power of BBC graphics. Several options are available to the user:

A draw an ellipse
B draw a triangle

C draw a square
D draw a pentagon
E draw a gcol pattern

Although written on a 1.2 OS model, the program runs on a BBC model A or B. It can easily be adapted for 1.0 models by

changing the VDU 23:8202:0:0:0; which turns off the cursor.

Notes

180 inputs access code
190 if access code entered is 374375 then proceed to menu
200-410 elliptical subroutine
420-620 triangular subroutine
630-840 square subroutine
850-1130 pentagon subroutine
1140-1390 gcol pattern subroutine
1310-1520 menu

PROGRAMMING AIDS AND LANGUAGES FROM

Audiogenic

FOR COMMODORE VIC-20 AND 64!

VP052 BUTI PLUS - £39.95 - Basic Programming Aid Commands PLUS Machine Code Monitor PLUS 3K Expansion! Basic aids include: APPEND, AUTO, DELETE, DUMP, EDIT, FIND, HELP, RENUMBER, REPEAT, STEP, TRACE, UNNEW, VIC, and DEC to HEX. Monitor Commands: ASSEMBLE, DISASSEMBLE, CENTRONICS, FILL, GO, MEMORY, HUNT, REGISTER, PRINTED DISASSEMBLE, LOAD, QUICK EXECUTE, WALK CODE, SAVE, TRANSFER, EXIT.

VP074 MONITOR VIC - £19.95 - Monitor on its own. Commands as above.

SB074 MONITOR 64 - £39.95 - 64 version. Commands as above.

VP078 MIKRO ASSEMBLER - £48.95 - Cartridge Assembler program for the VIC. Includes 3K extra memory. Write your machine language source code on Basic Lines which can be manipulated using the included toolkit commands. MIKRO uses standard MOS mnemonics, and features ASSEMBLER and DISASSEMBLER, plus TIM monitor commands, and special hi-res, sound, and joystick extensions.

SB076 FORTH 64 - £29.95 - Audiogenic Forth is very fast because it compiles right down to machine code, and very compact because it uses special screen compression routines. Audiogenic Forth contains a dictionary of over 200 Forth words, but the great thing about Forth is that you can define your own commands! Audiogenic Forth gives you full error messages (instead of codes), a full scrolling screen editor, and a comprehensive manual.

VP076 FORTH VIC - £34.95 - As above, but includes special VIC colour and sound commands. This version must be used in a motherboard with 8K+ expansion.

VP076/M FORTH VIC (with memory) - £39.95 - As VP076, but includes 3K expansion built-in so that you don't need a motherboard and expansion.

HURD

HIGH LEVEL USER FRIENDLY
REAL TIME GAMES DESIGNER

ALL YOU NEED
IS IMAGINATION

NOW...

THE GAMES YOU IMAGINE CAN
BE THE GAMES YOU PLAY

DESIGN YOUR OWN COMPUTER GAMES IN MINUTES

Introducing the incredible H.U.R.G. — The ultimate game program for people who want to really play games. With H.U.R.G. the hardest thing you will have to do is to think of a game title, and design the characters.

HIGH LEVEL — simply design the shapes you want, and H.U.R.G. will animate them into the most amazing on-screen action you've ever seen, choose any setting for your game, from mazes to outer space or sinister caverns — the only limit is your imagination.

USER FRIENDLY — H.U.R.G. will lead you through a so easy to follow procedure, ending in the creation of a game as wild as your imagination.

REAL TIME — You can see exactly what is happening at all times. Every game has hundreds of options, and you can change its features at any time. You can speed up the action, change the size of the characters and even make them move faster.

GAME DESIGNER — H.U.R.G. enables you to create your own games.

Now you can create all the stunning arcade effects on your Spectrum that up until now have only been available to professional software houses.

BONUS

To really fire your imagination, H.U.R.G. includes three ready-to-play fast-action arcade games, created using H.U.R.G.

Design a Game...
WIN
£3,000

Each month up until April 30 1984, three prizes will be awarded every month for the best games of the month

At the end, the best game will win a grand prize of £3,000

YOU could be a famous games designer! Every entrant has the opportunity of being published by Melbourne House and earning royalties.

Details of the competition are available with H.U.R.G.

Character information

Les Allan presents a program to transfer data from ROM into RAM

Where the video interface chip gets its character information is important to graphic programming. Normally, the chip gets this data from the Character Generator ROM which stores the patterns that make up the various letters, numbers, punctuation symbols and other things as seen on the keyboard. One of the more significant features of the Commodore 64 is the ability to transfer these shapes from ROM into RAM and to alter these to create user defined graphics for games, business applications, etc.

However, data transfer from ROM into RAM can cause a considerable delay prior to the running of a program. This can be particularly annoying when de-bugging a routine which relies on this feature at the start of a program. The comparison between the Basic and machine code routines clearly indicates the advantages to be gained by transferring this data into machine code.

Functional listing

10	clear screen: printing colour purple
12	screen and border black
14-62	text and routine for comparison
36	initiate basic routine
40	print time taken (note timer turned off by keyscan interrupt)
48	initiate machine code routine
50	print time taken (note time taken is related to basic entry of machine code)
60-74	basic code routine

60	lower memory pointers
62	turn off keyscan interrupt timer
64	switch in character
66	transfer complete character set (upper case and lower case)
68	switch in I/O
70	restart keyscan interrupt timer
82-90	machine code routine
82	set variables
84	read data: poke into memory: keep running total of sum of data
86	error trap routine for incorrect data entry
88	action machine code
90-118	decimal code for machine code routine

Machine Code Routine

49152	load accumulator with 48 (12288/256)
49154	store in 52 (bottom of string pointer)
49157	store in 56 (top of memory pointer)
49160	load accumulator with 254
49162	logical AND with contents of 56334
49165	store in 56334
49168	load accumulator with 251
49170	logical AND with contents of 1
49173	store in 1
49176	load x register with 0
49178	load accumulator with x increment starting 53248
49181	store with x increment starting 12288
49184	load accumulator with x increment starting 53504
49187	store with x increment starting 12544

SPRITES FOR THE DRAGON

Merlin's Sprite Magic offers a whole host of new features for the Dragon

Up to 128 sprites. Size up to 40 x 40 in mode 4, even larger in other modes. Sprite magic uses the 256 x 192 grid for screen addressing. Sprites are programmable for joystick control and/or keyboard control. Sprites may be defined as missiles fired from other sprites in response to fire-button or keyboard. Sprites may be programmed to rebound (like a bouncing ball), or wrap round, or disappear automatically when they get to the edge of the (user defined) screen. A wide range of commands and functions offers comprehensive control of speed, direction, screen edge behaviour and collision detection.

Animation is easily implemented with DRWG function which swaps the drawings being used for sprites and they needn't even be the same size.

Some of the commands are exceptionally powerful... MOVEN moves a single sprite, MOVEN.n moves a block of sprites, MOVEM moves the sprites. All the MOVE commands observe the individual direction, screen-edge, joystick and keyboard instructions for the various sprites. The REPORT function reports how many have crashed. The HIT function reports crashed sprite numbers.

Sprites are non-destructive i.e. they do not leave a "trail". They're fast and they're efficient and they're easy to use.

The Dragon now has its very own BEEP command. This one, however, offers a range of 16 pre-programmed gunshots, explosions, sirens, laser sounds and the like. You can also program your own... BEEP (six parameters) lets you generate the kind of noises you have heard on other high quality software.

Keyboard handling has had some attention too... optional auto-repeat, INKEY function returns ASCII code, KEY function does the same, but waits for a keypress. CLEAR key clears hi-res screen and homes the print cursor.

We have also included a couple of routines to provide text on the hi-res screen... in all PMODES with enhanced cursor controls providing relative as well as absolute positioning. PAGE command, HOLD command (to fix headers or graphics), COLOUR command changes text foreground and background colours etc. The hi-res screen is used just like the Basic text screen, including editing. You can also re-define the character set using the friendly new command CHR(n) = eight row values.

Sprite Magic requires absolutely no knowledge of machine code. The comprehensive manual describes the new Basic commands in full, with lots of examples. As well as the documented demonstration program, the cassette includes Character and Sound Generators, Mate in two (yes you can!), Shooting Gallery and Breakout. Price £17.25 all inclusive.

ATTENTION PROGRAMMERS

OBJECTIVE To increase the range of computers we service taking into account new machines on the horizon that are destined to make a large impact on the consumer market.

REQUIRED 4 programmers of high ability and proven track record on popular micros to work with us on new projects of your choice related to our existing product portfolio. Working in a place of your choice but in close contact with our present staff of 23 people.

REWARD For your abilities you would expect to earn in excess of £30,000 per annum in a financial environment designed to let you retain the maximum amount through prudent tax and legal advice.

CONTACT in writing and in strictest confidence giving full details of your career to date with examples of your work if possible. Mark your application Confidential and address it to Martin Maynard. I will arrange an informal meeting without obligation to discuss our plans.

AUDIOGENIC LTD
34-36 Crown Street
Reading, Berks

WIN THE POOLS?

SPECTADRAW 2 — THE BEST SELLING POOLS PREDICTION PROGRAM FOR THE 48K ZX SPECTRUM

The program looks at the recent form of the teams playing in each week's English and Scottish football league matches and then refers to a large database to see what has happened in the past when teams with similar form met. By combining the lessons learnt from the past with the teams' current league position, the program generates a draw probability factor for each match. It can then identify the matches which are likely to yield draws and output suitable predictions. It will also output the least likely draws for the benefit of those who prefer the fixed odds lines on coupons.

Program, 8000 match database (both on high quality cassette) and instruction manual £12.95 inclusive.

NEW!!! SPECTASORT — THE PERM GENERATION PROGRAM

Spectasort takes the 14 most likely and 10 least likely draw predictions and produces ten from 10 full over perms, enabling you to complete your pools coupon directly from the screen. The program will run on its own in 16K, using your own predictions, or has the unique feature of being able to merge with SPECTADRAW 2 to provide a complete Pools Prediction package!

Spectasort program on high quality cassette £4.95 inclusive.

(Cheques/POs payable to B. S. McAlley)

OPEN FORUM

Open Forum is for you to publish your programs and ideas. Take care that the listings you send in are all bug-free. Your documentation should start with a general description of the program and what it does and then give some detail of how the program is constructed. We will pay the *Program of the Week* double our new fee of £6 for each program published.

Las Vegas

on Vic 20

Full instructions are included in the program for this game. The game is written for a 3.5K VIC20 and has been written in two parts. The first part must always be loaded and run before the second part as this is the part which sets up the udg's and tells

the instructions.

The second part is the game itself, there is a little room for improvement mainly adding more colour and sound. One thing I forgot to add in the instructions is that every time you drop a coin you lose a chance and after you have lost three chances then you are sacked.

To make getting to the game (bonus) easier you must do the following and change line 34 to the following:

```
IF RIGHT$(SCF,2) = "50" OR RIGHT$(SCF,2) =  
"00" THEN GOTO #000 £ = dollar
```

Program notes

1-9	Setting up of the game
10	Prints the man on the screen
11	Take character which is pressed
11-12	Act on which character is pressed
13-17	Prints data on score etc
18	Prints coin deletes old coin
19-24	Move coin down one if already on the screen and if no coin on screen put one on
25-27	Check if the coin has been missed on. If it has reset it back to the top
28-31	If coin is caught then add to score and make noise
33-34	Check if score is 100 200 etc, and if it is gold bonus game
35	Go back to the start of the loop 'line 8'
1000-1014	Print instructions for the bonus game
1113-1151	The playing of the bonus game
2000-2010	End of the game. If high score take and store name.
3000-3003	Sound when a coin has been caught

Eye of the Star Warrior

Meteor Storm

on Dragon 32

This is a version of the popular arcade game in which you must travel as far as

possible through a meteor storm without crashing into a meteor. Movement is controlled by the right joystick.

The program is written entirely in machine code. To enter it, type in the machine code loader and then enter the

figures either as ■ separate group of two, or multiples of two. ■ will stop the loader. It very easy to make mistakes so be careful. Once you have finished save it immediately using Csave "Meteorst". 13824, 14680, 856. Run the program using Exec 13824.

PROGRAM OF THE WEEK

TO ALL SOFTWARE PRODUCERS!

Are you interested in a virgin market?

There's a British-owned company in Switzerland ready to handle your software, nationwide, on a mail-order basis. "Sofse" ... is part of 'School of Spoken English', which provides courses throughout industry in Switzerland, so most of our students are interested in business and educational software for micros — but they join the kids when it comes to games, just — with Swiss efficiency! — to make sure they work ...

Send updated info., demo tapes, discs or cartridges, plus separate price lists including 1st class postage if applicable, plus usual replacement guarantees, for: CBM 64, VIC20, TANDY, TI 99, SPECTRUM (I, II, III), ZX81, SHARP MZ 700, IBM, SIRIUS, DRAGON 32. User instructions must be printed in German, French and preferably Italian. If none available, we can offer a translation service. N.B. There is no V.A.T. in Switzerland.

Please quote min/max mailing time and whether phone/letter orders. To:

ROGER WORROD,
"Sofse",
Place Bel-Air, 1
1003 Lausanne, Switzerland.
Tel: 010.41.21.876451

We can also offer nationwide distribution in Italy through: Roger Worrod, c/o ARCHIMEDES s.r.l., via Villa Magna 22, FIRENZE, Italy. Common Market invoices; user instructions IN ITALIAN.

TEACHERS AND EDUCATIONAL GAMES DESIGNERS

We are looking for top quality educational material for release on the BBC Model B, Elektron and Dragon computers. We can offer excellent royalties or outright purchase of copyright. Please send your work on cassette or call Mark at:

POOLSWINNER

THE ULTIMATE POOLS PREDICTION PROGRAM

PREDICTS Not just SCOREDRAWS, but NOSCORES, ALWAYS and HOMES

IT WORKS We guarantee the program performs significantly better than chance

ADAPTABLE "Poolswinner" allows the precise prediction formula to be set by the user — you can develop and test your own unique method. Probabilities are given on every fixture — choose as many or as few selections as you wish

EASY TO USE Fully menu driven, with detailed instruction booklet

DATABASE The program comes complete with the largest database available — over 20,000 matches. The database automatically updates as results come in

APPLE, BBC (B), COMMODORE 64, DRAGON, SPECTRUM (48K), ZX81 (16K)
£15 (all inclusive)

We produce databases for those developing their own prediction program. Two years results £7. Five years results £12.50

Available from dealers, or direct (return of post) from ...

Packet radio

This week Microradio is in the news business. Well, I've received a press release anyway. The press release emanates from The Tucson Amateur Packet Radio Corporation and gives details of their new Terminal Node Controller (TNC).

Packet Radio is a very, very exciting thing. Here I am, week after week, talking about micros and radio, about adapting computers to existing modes of communication like Morse and RTTY, and at last

it all comes together. A mode designed for the computer; digital information that is direct and faultless; messages, even programs, that can be sent without error either round the corner or across the world, and for free. Not a penny on the phone bill. So what is packet radio?

Packet radio is a means by which you can send the information in your computer's memory to another computer in small bursts or packets. A packet can be up to 256 characters long and, like a parcel, has address information and a verification technique to make sure that the packet received is the same as the packet sent. All that is needed is a micro, a transceiver and a terminal node controller (TNC).

A TNC is an interface or circuit board which encodes and decodes the packets. If the packet isn't verified on receipt, then the TNC makes it

send it again, so it is error free. It's not even vital that the computers are the same because the transmission is in binary and the TNC takes care of everything.

In a sense, the TNC is a micro in its own right. Your computer can talk to the TNC through an RS232 interface and the TNC encodes the packets and sends them off instantly. As you type on your keyboard, the letters come up on your friend's screen and vice versa. You can say hello or send your latest space invaders creation. And most important of all, it's accurate and very, very fast. If your friends are not in, send the packet anyway and it will be stored for them until they want to access it.

A packet can be sent through repeaters and, much more exciting, through satellites. Packet radio has been operated successfully between

New York and New Zealand via satellite Oscar 10 and plans are well advanced for a new PACSAT satellite. The speed of packet radio means that you could send an adventure game in the same space of time (pardon the pun). Exciting? Who said this was the age of the train?

A TNC costs 240 dollars, details from Tucson Amateur Packet Radio Corp, PO Box 22888, Tucson, Arizona 85734, USA. No doubt it will cost £150 or more here, but it does have 30K non volatile Ram on the board and almost as much in Rom.

Ray Berry GW6JJN

This series of articles is designed for radio and microcomputer enthusiasts alike. If you have any queries that you want answered, hints and tips to share, or topics that you would like to see covered, write to Ray Berry, Microradio, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Adventure Quest

This week I have a query from Neil Scrimgeour who has been stuck for the past two months in Wintersoft's *Ring of Darkness*. This program, which has been such a success on the Dragon, has recently been released on the Spectrum.

Neil has a common problem. Despite completing the Dragon's sign quest and going down the labyrinth of doom, becoming a level two dwarf in the process, Neil seems unable to get any more money. I know how he feels.

With only 150 gold pieces, Neil cannot buy enough hit points or food to complete the quest. What Neil wants to know is whether there is any way he can gain money easily, apart from killing bandits?

Well, Neil, to some extent it depends on the character you choose at the beginning of the program. A thief, for example, can steal money or valuables to add to his wealth.

As a tip to other adventurers, Neil notes that it may be useful to have a bath plug when entering the aquarium in *Franklin's Tomb*.

Now, I am grateful to David Swain for the following reviews of *Adventure Quest* and *Snowball* from Level 9 Computing. As with other Level 9 adventures, these two programs are available on BBC, Commodore 64, Spectrum, Lynx, Nascom, Oric and Atari.

Adventure Quest is the second adventure in the *Middle Earth Trilogy* from level 9 computing and carries on from *Colossal*, an adventure about which much has been written. You are an apprentice magician and, because all others seem to have failed, you are given the chance to try and defeat the demon lord Agaliarept who resides in the dark tower.

The object of this adventure is firstly to search for and find the four stones, no mean feat in itself, and secondly to use these stones to enter the dark tower. Finally, you must defeat the demon lord by means of magic and a helpful companion.

Here we have an adventure with just about everything. You start outside a small brick building surrounded by forest, travel through swamps — ward off savage wolves — find cunningly hidden objects, then proceed, if you dare, across a dry arid desert. But, keep a wary eye for the giant sand worm, whose powers are mightier than the sphinx. Use its great powers, if you know how, climb mountain ranges to defeat giants and orcs in their castle — slip into dark caves and tumble into roaring underground torrents.

If you can open the rusted door, enter the vast cavern — light off more orcs, giant spiders and dragons and then dare to enter a fire licking erupting volcano. Find your way through a swamp, avoiding grasping skeletal hands, Will O' wisps and vampires, to the very shadow of the dark tower.

Work out the combination for the locks and enter the demon lord's dark tower and,

if you can defeat him, claim the title 'Grand Master Adventurer'.

This has always been one of the best adventures for me as it seems to contain the lot. In all it took me about eight months to solve. It has the usual *Save/Restore* facility and you do have three lives before you have to start over again. As with *Colossal*, there is a puff of smoke and you find yourself elsewhere, not always to advantage.

A good little booklet setting the scene comes with the cassette and an envelope and hint token should you become hopelessly stuck.

Snowball 9 is the first adventure in the new *Silicon Dream Trilogy*. Here again, we have all the expertise we have come to expect from Level 9 Computing — this adventure has over 7,000 locations.

Snowball 9 is a colony starship launched in the 2190s from the EEC's Ceres Base, with thousands of colonists on board. Something has gone wrong and it is up to you, as Kim Kimberley, to rescue *Snowball 9* from disaster.

You are lying in a freezer coffin in total darkness, always a good one for openers. Extricate yourself from this and you find that you are in a mortuary. Travel a few paces and find that you are almost trapped in a vast cylindrical complex of many mortuaries — about 2,000 I believe, I didn't have time to visit them all, though I am sure you could. So, the sooner you learn the colour light coding system, the sooner doors begin to open into other parts of this vast starship.

The appeal of this adventure is the distinct lack of monsters — there are really only two slightly nasty guardians, the nightingale to be avoided at all costs and the rather stubborn waldroid. This does allow you to concentrate fully on how you are going to perform the various tasks.

In all, about 40 objects have to be found and used, but you can only carry about four at a time. You must adventure out into darkest space, across snowfields — shuttles and recreation areas where there are forests and snake pits, or are there? And on and on to *Snowball's* central control room and hopefully final success.

An absorbing adventure giving, I think, a good few hours of pleasure. My one reservation being that too much detail is built into the earlier parts of this adventure at the expense of the closing stages where lack of detail and problems makes the final rescue too simple and an anti-climax. However, I am now looking forward to part two of the trilogy, *Return to Eden*.

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed, or if you are stuck in an Adventure and cannot progress any further, write to: Tony Bridge, Adventure Corner, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Are you stuck in an adventure? Are you faced by a problem that seems insurmountable? *Adventure Helpline* may be the answer.

Adventure Helpline is, quite simply, designed to put adventurers in touch with one another. Where you may be stumped by a baffling puzzle, a fellow adventurer may be able to help. By the same token, you may be able to help other people with their problems.

If you are having difficulties with an adventure, fill in the accompanying coupon and send it to:

Adventure Helpline
Popular Computing Weekly
12-13 Little Newport Street
London WC2R 3LD

We shall publish *Adventure Helpline* entries each week in their own special column.

HISOFT PASCAL DEVPAC

Quality ZX SPECTRUM® Software HISOFT PASCAL 4T

"I haven't seen any other compiler that could match Hisoft's Pascal". Using the Spectrum Micro - Autumn 1983
"This is a very impressive product... of benefit to any Spectrum programmer". David Bolton ZX COMPUTING Aug/Sept 1983

Just two comments from full length reviews of our powerful and virtually full implementation of Standard Pascal. The advantages of using Pascal are well-known - fast, self-documenting, and above all, structured programs and now, with Hisoft Pascal, you can reap all these benefits on a wide range of home computers, including the 48K Sinclair Spectrum! Hisoft Pascal produces programs that run typically 40 times faster than equivalent ZX BASIC programs and, sometimes, up to 1,000 times faster!

Hisoft Pascal supports FOR...DO, WHILE...DO, REPEAT...UNTIL, CASE...OF, INTEGERS, REALS, CHARACTERS, RECORDS, POINTERS, SETS, ARRAYS etc etc - It is not a Tiny Pascal but a virtually full implementation of the language allowing the user to develop true high-level language skills while attaining execution speed close to that of machine code. Complete with a 70-page manual!

HISOFT DEVPAC 3

DEVPAC is most highly recommended. The documentation is first class. Your Computer May 1983

"If you write programs in machine code, buy DEVPAC - it is the best currently on the market". Adam Denning, ZX SOFT in Which Micro September 1983

Two comments from reviews of earlier versions of DEVPAC - now we have DEVPAC 3 available, a powerful Z80 assembler with conditional assembly, assembly from tape (to enable generation of very large code files), ORG, EQU, DEF, DEF, DEF, DEF, DEF, labels of any length - in fact all you need for fast (3,000 lines per minute) and powerful assembly programming. But it doesn't stop there. DEVPAC 3 also includes an incredible debugger de-assembler giving you a front panel display of the Z80 system and allowing extensive debugging of your machine code program, including single stepping programs EVEN IN ROM! Open up the secrets of low-level programming with DEVPAC 3.

Prices:
Hisoft Pascal 4T (ZX SPECTRUM) £25 inclusive
(NewBrain, SHARP MZ700 etc) £30 plus VAT
Hisoft DEVPAC 3 (ZX SPECTRUM) £14 inclusive
(NewBrain £25 inclusive)

STOP PRESS Hisoft Pascal for the SPECTRUM now comes complete with a Turtle Graphics package allowing fast and easy production of complex graphic displays

WHITE ON BLACK

M Henderson of Great Eastern Street, Cambridge, writes:

Q I have recently bought a ZX81, just to see how I and new technology mix. I have done the various tuning tricks to get a good screen picture, and I can now get an adequate display.

However, a friend says that somewhere she has seen an advertisement for a module that will improve the quality of the screen picture by reversing the black and white. Is this true and, if so, can you give me any details about it?

A I think you are describing the Fitch inverse video module. This gives a very good inverse display that is usually much clearer than the normal picture. It is available from D Fitch, 6 Stanton Road, Thetford, Cheshire WA4 2SE. The cost is £7.50 if they fit it for you, or £4.00 if they send you a kit.

VIDEO SIGNALS

Y Henderson of St Ives, Huntingdon, Cambridgeshire, writes:

Q I have an Atari home computer, but recently I have become more interested in making home videos. As the magnetic tape is the same, is there anyway that I could record computer graphics and text on to my video films?

A Yes, it is possible. But, I do not know of any system commercially available for the home computer market.

What you need is a video mixing unit. This will allow you to mix more than one video signal on to a single tape. It then sends the mixed signal to the modulator for display on a screen. Although it may

sound the same as sound mixing, and the theory is approximately the same, the greater amount of information that needs to be stored for a television picture makes it correspondingly more complex.

DIRECT COMMAND

Paul Gurney of Hereford Road, Hereford, writes:

Q I have a 16K Spectrum and on page 16 of the manual it says that if you enter as a direct command *Clear 23800* it will give you an idea of what happens when the memory becomes full. All I get when I do this is *M-Ramtop no good*. This happens even when I switch on and enter this at once. Is this meant to happen, or have I got something wrong with my Spectrum?

Also, can you tell me how to use both *Attr* and *Screen\$* on my Spectrum as I do not understand them from the manual? How do you use *Screen\$* to find out what is printed at a certain position on the screen?

A To answer the second part of your question first, *Screen\$* is a command not well documented in the otherwise excellent Sinclair manual, which would have you believe it is only useful for saving pictures onto tape. In fact, the format *Print Screen\$ (y,x)* means print the character found at line y, column x. You can use this to determine events according to a given screen position by using a line like *If Screen\$ (15,20) = "A"* Then *Print "Bang"*. The problem is, though, that *Screen\$* can't recognise user defined characters, so in practice you won't find much use for it in games.

Instead, you should use *Attr* which reads a value at a given point on the screen — that value depends on the colour of the square and whether it is flashing or not — look in the manual for the exact formula you need. If, for example, you have a green flashing alien and you need to know if he has reached a particular point on the screen, you would find out the *Attr* value for green flashing and have a line like *If Attr (x,y) = (value for green flashing) Then ...*

The *Clear* command is simpler to explain. The memory of the computer has been assigned to different tasks and is divided up accordingly. Normally, there is a certain amount of room for Basic programs. Supposing, though, you need more room and your program does not require any user defined graphics — by moving *Ramtop* up in memory you will give yourself that room by overwriting the section usually reserved for user defined graphics.

By typing *Clear 23800* you are deliberately allowing yourself no space for Basic whatsoever and thus you get the response *Ramtop no good*. It has been moved too far down.

BASIC COMPILER

Douglas Lockhard, of Elie Place, Barnhill, Broughty Ferry, Dundee, writes:

Q My Dad and I have decided to buy a ZX Spectrum. I am aware that it is still early days yet, but I was wondering if you knew of a Basic compiler that was available for the Spectrum (the thought of being able to write programs in Basic, and then have them converted to machine code, seems very inviting). If you do not know of one, could you please write out, or explain how to write, a compiler?

A The idea of a compiler is very attractive — instant machine code at the touch of a button! But, it's not as simple as it sounds. Some Basic commands cannot be compiled, some types of dimensioned strings for example. The end result may have the speed of machine code, but it will usually take up a lot more memory than a program written in code from the start.

What a compiler will do is speed up most, straightforward, arcade type games, thus making them more exciting and competitive than the often plodding results you get from

ordinary Basic.

Fortunately, there are a couple of commercial compilers available so I don't have to spend the next 27 Peek and Pokes explaining how to write one! The two I know of are Softek 'FP' Basic Compiler £19.95, Softek, 329 Croxted Road, London SE24, and M Coder, £9.95, from PSS, 452 Stoney Stanton Road, Coventry CV6 5DG. Softek also do a stripped down version of the above compiler for £9.95.

STARRY NIGHT

Colin Langveld of Lisholme Road, Liverpool, writes:

Q I would be obliged if you can help with what must be a very simple matter. I have a space ship, (value X) trying to make a planet full, with the sky full of stars. The trouble is that as the ship descends, it wipes out the stars. I know that the answer is to Peek, but how do I use this command on my Vic20? Perhaps it's my age. They say that by the time you reach 40 you lose X bytes every day.

A The answer to your problem is simple, if a bit cumbersome. You are quite right in assuming that a Peek is the answer. I guess you are using the full stop for your stars, which have an Ascii code of 46. What you need to do is Peek the appropriate screen location and see if it has a value of 46; ie, if a star (full stop) can be found there.

To prevent the ship 'rubbing out' stars, use a variable to record the position of the ship and look at the screen location \square spaces further on; ie, the next square. Peek this square to see if it contains 46 (a star). Now you need to store this fact by recording the screen address using a variable. So *If Peek (the memory address of the square 22 on from the ship) = 46 Then Let x = (the address above)*. As soon as your ship has moved past the square, *Poke x with 46* and you have your star back.

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem Peek it to Ian Beardsmore and every week he will Poke back as many answers as he can. The address is *Peek & Poke, PCW, 12-13 Little Newport Street, London WC2A 3LD*.

Mastercode Assembler for the Commodore 64

Full Commodore 64 Assembler/Disassembler

£14.95
inc VAT

Mastercode is a substantial and complex program of use to anyone interested in writing machine code on the Commodore 64. Its features include:

- ☐ Machinecode monitor
- ☐ File Editor
- ☐ Disassembler
- ☐ Assembler

Mastercode is a full two pass assembler. It accepts labels, variables and equations within assembly language programs. It is possible to store programs anywhere in memory, even in parts occupied by the Assembler. Programs can be saved to either tape or disc.

The Machine Code Monitor includes:

- OUTPUT OF MEMORY TO SCREEN OR PRINTER ■ MODIFICATION OF MEMORY ■ EXECUTION OF MACHINE CODE PROGRAMS ■ SAVING OF MACHINE CODE FILES ON TO TAPE OR DISC
- LOADING OF MACHINE CODE FILES FROM TAPE OR DISC ■ STEP BY STEP TRACING OF THE EXECUTION OF A MACHINE CODE PROGRAM, INCLUDING DISPLAY OF REGISTER CONTENTS.

The Disassembler will translate into assembly language the contents of any area of memory, whether the 64's ROM or a user program. Output may be sent either to the screen or a printer.

The File Editor includes:

- ENTRY OF NUMBERED LINES OF ASSEMBLY LANGUAGE INSTRUCTIONS ■ LISTING, INDIVIDUALLY OR IN BLOCKS, OF PREVIOUSLY ENTERED LINES ■ DELETION, INDIVIDUALLY OR IN BLOCKS, OF EXISTING LINES ■ RENUMBERING OF EXISTING LINES ■ SAVING OF ASSEMBLY LANGUAGE FILES TO TAPE OR DISC ■ LOADING OF ASSEMBLY LANGUAGE FILES FROM TAPE OR DISC ■ ADDITION OF A BLOCK OF MEMORY SPECIFIED BY THE USER TO THE USER'S ASSEMBLY PROGRAM

The Assembler allows the translation of assembly language programs into machine code with full error checking, labelling and a range of assembler directives.

SMALL DOT

3D Seiddab Attack is one of the most unimpressive 3D programs I've seen yet on the Spectrum and there are quite a few of them.

In this you are behind the wheel of a Drone — a super modern tank patrolling the city streets. This involves watching your radar screen for the appearance of the small dot that denotes the presence of a Seiddab — chase it until it comes into view and then, well, you can guess, can't you?

If you succeed in clearing the first screen, you are then transported to the countryside outside the city where you make a much easier target for the unpleasant machines.

The screen display is great, showing the front of your tank as you move it round the city streets, and the radar and range-finder displays for locating the enemy — it's very well done.

EVIL WITCH

Epic is a new software house catering for those BBC owners who want to test their intellectual mettle on the kind of vast text adventures more commonly associated with mainframes and, more recently, the Spectrum computers.

The company currently has three 32K adventures available: *Castle Frankenstein*, *The Quest for the Holy Grail* and *The Kingdom of Klein*.

In the last of these, your quest is to return the stolen magic Klein Bottle — anyone foolish enough to attempt to recover it has been promised hideous retribution from an evil witch.

Can you defy the curse and solve the mystical properties of the five solids (whatever that means) in order to kill the witch? All the games in the series have around 230 locations and are machine coded for fast response times.

Program The Kingdom of Klein

Leicester LE8 0HL

KAMIKAZE

Now for the Electron comes *Birds of Prey*, a version of *Phoenix* that retains most of the features of the original.

True to Alfred Hitchcock's awesome predictions, the birds have gone on the offensive (and in space at that). They are attacking your (here's a post-Christmas puzzle for you — fill in the missing letters) j-o-e l-s-r b-e, which is all that stands between the birds and something very nasty indeed.

The birds first of all attack in formation, when they are relatively easy to shoot. But later birds attempt kamikaze runs directly on your base which you will find difficult to

avoid. A good implementation of one of the classic arcade games.

RED ARMY

Wilfred the Hairy, Olaf the Hungry is the surprising title of a strategy game in which you try to take over the world. Well, you have to start somewhere.

Wilfred and Olaf are represented respectively by blue and red armies which are moved by cursor keys. You must fight battles, making sure that you are well supplied with ammunition — should you run out, you'll have to return to your home castle.

The computer plays for the red army and is equally concerned with maximising its territory without overstretching its resources. Microbyte, who manufactures the game is stressing its tactical elements — don't expect any easy victories.

CAMELS REVENGE

Maintaining some sort of dromedary karmic balance, Jeff Minter, llama-obsessed mastermind behind Llamasoft, has decided to issue *Revenge of the Mutant Camels*, a follow up to *Attack of the Mutant Camels*.

I will not attempt to paraphrase the cassette blurb which explains the history of the mysterious camels and the events of the game, suffice to say that it is very funny and I am pleased to announce that now the camels are on our side.

Using the joystick, you must pit your camel against some of the most bizarre adversaries

ever seen in an arcade game, including goats, kangaroos on skis and telephone boxes. The graphics are superb.

As a final point of interest, the game incorporates a new loading system which will function on good quality tape systems and load the game in under two minutes instead of the usual 15 minutes.

IN KEY

Dancing Feats is another music program for the Commodore 64 — given the computer's music making capabilities, it hardly comes as much of a surprise there are so many.

This looks to be one of the simplest to use — the only thing you have to master is the joystick which you use to play the notes. The computer will keep you in key and the fire button lets you change the octave.

Aside from this, you can choose the kind of bass effect you want and other features like style and tempo. Finally, you can record and playback your masterpieces.

AIR COMBAT

Digital Integration are not backward in coming forward — the blurb for *Fighter Pilot* contains a long list of reasons why its *Flight Simulation* for the Spectrum is better than

that other well known *Flight Simulation* — the one by Psion.

Pretty convincing the claims are too, backed up by some screen photographs showing the runway approach. In this simulation you are piloting a jet fighter and can practice landing, take off, combat, air to air combat, etc.

With all simulations, you need to spend a lot of time before a sound judgement can be made, but I think this one really does live up to its claims — the 3D views of the runway approach in particular are most impressive.

BBC SPRITES

The BBC has wonderful graphics but it does not have sprites — those extremely useful objects that enable you to create convincing and smooth movement.

The *Sprite Master* gives you the facility to create multi-coloured sprites on your BBC which can be moved anywhere on the screen. Up to 32 may be used simultaneously.

Each sprite can be assigned one of 16 characters and you can use any of the graphics modes. Each one is 100 graphic points square, although it is easy to create a smaller shape simply by leaving edges blank.

The program comes with some demonstration programs

and relatively simple instructions.

SCORECARD

Junior Wordsplits is one of Sulis Software's educational packages for the BBC B.

The program is aimed at the 8 to 11-year-old age group and it is all to do with recognising words in order to spell them properly.

The computer has a vocabulary of more than 500 words and the words appear in a different way and in a different order each time. The program comes with a scorecard so you can keep track of your child's progress.

BUSINESS RECORD

As soon as the Microdrive becomes reliable, there are going to be a lot of small businesses finding uses for their Spectrums which they never suspected.

Transform has versions of *Purchase Day Book* and *Sales Day Book* on the B side of the cassettes which you can save to

Microdrive.

The programs themselves are concerned with the day-to-day running of a shop or other business, keeping records of cheque payments with *Purchase Book* and keeping track of invoices with *Sales Day Book*.

Both programs come with instructions on their use and information can be printed out to both ZX and full size printers.

BOVVER TEDS

More disillusionment in the bear department I'm afraid — some of you may remember my horror when I discovered that in *Teddy*, by Supersoft, bears ate snakes. Now they are getting violent.

Bear Bover is the latest game from Artic and it depicts bover bears — brusque nasty fellows who chase you all over a maze of ladders as you try to get at some batteries for your car (it conks out every few yards without a new one).

The bears are beautifully done, using large animated sprite effects as they climb up and down the maze of ladders trying to prevent you from getting to your batteries. One of the best yet from Artic.

ROGER 1

Ever fancied sitting in the control tower saying things like "Roger 2 Victor Zero vector on two three seven"? No, neither have I.

But, you might change your mind should you buy *Air Traffic Control* by Microdeal — a program available for both Dragon 32 and BBC.

You must take charge of a

number of RPVs (Remotely Piloted Vehicles) and ensure that they don't crash whilst you guide each one to a safe and secure landing.

There are various graphic displays showing the position of the various aircraft and the runway when you are attempting a landing. The program also allows you to take off and perform various other manoeuvres.

TEE OFF

Golf simulations abound, but *Royal Birkdale* is the first I've seen to be based on an actual golf course — the game even has the approval of the club.

The author created the program from an actual plan of the course. Unlike some of the early golf game efforts, this seems to have benefited from the need for ever better graphics with the advent of the likes of *Ultimate* — consequently, when you tee off you actually see a little man swinging his club.

It has all the usual features of computer golf — you choose the club, taking into account wind speed and direction, and the computer keeps score.

CONVERSION

Maths + Computers = Fun is the sort of title guaranteed to bring on a bad case of nausea — it's a computer book that shows some mathematical uses for your computer, particularly tied to school work.

In fact, it looks a useful book, collecting as it does, all the useful routines for decimal conversion, percentages, fractions, etc, you could ever need under one cover.

ANALYSIS

Take off with the Electron and BBC Micro is a book that makes use of the fact that both micros run the same Basic; the only difference being that one of the machines runs the Basic at about twice the speed.

The book contains a number of moderately useful programs none of which really rely on speed for their effects. More importantly, in the long run,

all the programs are quite well documented with a line-by-line analysis.

Book *Take off with the Electron and BBC Micro*
Price £5.95
Micro BBC/Electron
Supplier Granada Publishing
8 Grafton Street
London W1N 3LA

ROBOTIC

DIY Robotics and Sensors is a book intended for the BBC computer that could be of general interest.

It deals with the ideas behind peripherals, analogue and digital, input and output and so on. Using this knowledge, you are shown, through simple circuit diagrams, how to construct things like a simple robot eye and a stepper motor suitable for things like buggies and robots.

For the BBC owner there are a number of Basic and Assembler listings to help put these ideas into operation.

This Week is a new section that covers all the new software coming on to the home micro market each week. All suppliers should send details of their new programs to: This Week, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Zigurat

Kettle of fish

In this final part of this particular stint on Zigurat, I want to briefly examine a couple of more obscure languages.

Smalltalk enjoyed a brief period of fame when the Apple Lisa was introduced. Many people get confused between the Smalltalk programming environment, as implemented on the Xerox Star, and the language itself. The environment is obviously pretty useful.

However, the language itself, without getting too deeply involved, is a very odd kettle of trout. As I understand it, Smalltalk stores everything in the same way: the symbol for the thing, the operations that may be carried out on the thing and so on. Thus, numbers are stored in this way, and may be added, subtracted, etc. So are the symbols for addition, multiplication and division, etc.

The designers have tried to make the language as uniform as possible. Thus, there are very few concepts to learn for Smalltalk because the same concepts apply to everything. The end result is undoubtedly elegant, but it suffers from not taking our intuition into account. Everyone who reaches an advanced state in programming knows the difference between operators, functions and statements, and does not need the process 'simplified'.

I am not implying that Smalltalk is hopeless, just that it is near the start of a road towards a genuinely useful new concept in languages.

Probably the single most important language not yet mentioned is assembly language. A modern assembler, such as Macro-86 on the 8088/6, comes very close to being a high-level language. I particularly like the rich variety of addressing modes available in assembly languages — even the humble 6502 has some

extremely powerful, if under-implemented modes. Many of these modes can be realised through the use of indirection operators. Many readers will be familiar with the \$, ! and ? of BBC Basic, but this is only the beginning. I should like to see another operator that implements stacks. I propose stacks be defined with a line like:

```
VAR BLOCKS STACK 500 INTEGER;
```

This could define a stack that holds up to 500 integers. A symbol could then be used to push and pop numbers as follows:

```
!BLOCKS+23  
PRINT !BLOCKS
```

A right-hand square bracket puts a number on to the stack and a left-hand one removes the number. Another symbol, or both symbols combined, could then be used to examine the top element of the stack without removing it. It would be useful to be able to implement indirection in variable names (this will only operate in an interpreted environment). For example:

```
VAR NAME STRING 100;  
WOW INTEGER;  
BEGIN  
NAME = 'WOW'  
PRINT @NAME  
END
```

I have assigned the @ symbol for indirection. It is followed by a string variable which contains the actual name of the variable to be used. One could then write lines like: Print @@@@@@@@@@@@@@@@@NAME, which would be guaranteed to irritate everybody.

Stacks are useful in many applications, mainly graphics and languages, but indirect variable names are of more limited use, so I cannot seriously propose them. Of course, they are a type of addressing mode too, as are stacks (on the 68000 at least).

The computer that is going to run our Ideal language will be 16 bit. It will have at least 128K of Ram, and some form of mass storage, so all the ideas I have discussed are quite possible.

The real point of this series is that, despite the great ease with which we have discussed a feasible, useful, powerful language, it will not be adopted. Instead, manufacturers will be sending computers limping on to the market place with Microsoft Basic and Sinclair Basic — even BBC Basic.

Jeremy Ruston

Puzzle

Digital letters

Puzzle No 89

Here is an alphametic number puzzle in which the idea is to substitute digits for the letters in the following multiplication sum:

DAYS * 7 = WEEK

As is usual with problems of this kind, each different letter stands for a different digit, and the same letter always represents the same digit.

How many solutions can you find?

Solution to Puzzle No 84

The program generates the prime numbers from 11 to 99 and can then be modified to determine if larger numbers are prime.

```
10 FOR N = 11 TO 99 STEP 2 20 FOR F = 3 TO  
(SQR N) + 1 STEP 2 30 LET X = N/F 40 IF X = INT X  
THEN GOTO 70 50 NEXT F 60 PRINT N 70 NEXT N
```

Of the primes between 11 and 99, all those containing either an even digit or a nine can be ruled out. Each of the remaining numbers should be paired, so that the last digit of the first prime matches the first digit of the second. This will result in a list of three digit numbers. Each of these should then be tested by modifying the program to check each number to see if it is prime. Any composites on the list can be crossed off. For example, the first prime, 11, can be paired with 11, 13, or 17 to form 111, 113, and 117. Of these, both 111 and 117 can be eliminated as being non-prime.

This procedure can be continued with the new list of three-digit numbers by tagging on further two-digit primes. Each of these new four-digit numbers should be tested in the same way. Each time composite numbers can be removed from the list.

The procedure is then continued until all but one number is eliminated.

This final number is the answer: 31373. Every digit, pair of digits, three consecutive digits, and four consecutive digits are prime numbers.

Winner of Puzzle No 88

The winner is: Dave Jones, York Close, Beckton, London, who receives £10.
